

CLAIMS

What I claim as my invention is a multi-bladed scalpel for making incisions in skin, such that:

- 1.) There are many blades in one scalpel, and those blade tips define a plane that is at an ergonomically desirable angle to the top plane of the handle,
 - 2.) The spacing between blades is varied by a few thousandths of an inch to minimize any appearance of a pattern.
 - 3.) It has an adjustable depth gauge, with blade placement clearly seen from all angles.
 - 4.) Blades, and therefore incisions, can be spaced as close as 0.030" to mimic natural hair density.
